

Colorado's Complex and Beautiful Climate

Peter Goble

Service Climatologist/Drought Specialist

COLORADO STATE UNIVERSITY

COLORADO CLIMATE CENTER

Providing information and expertise on Colorado's complex climate

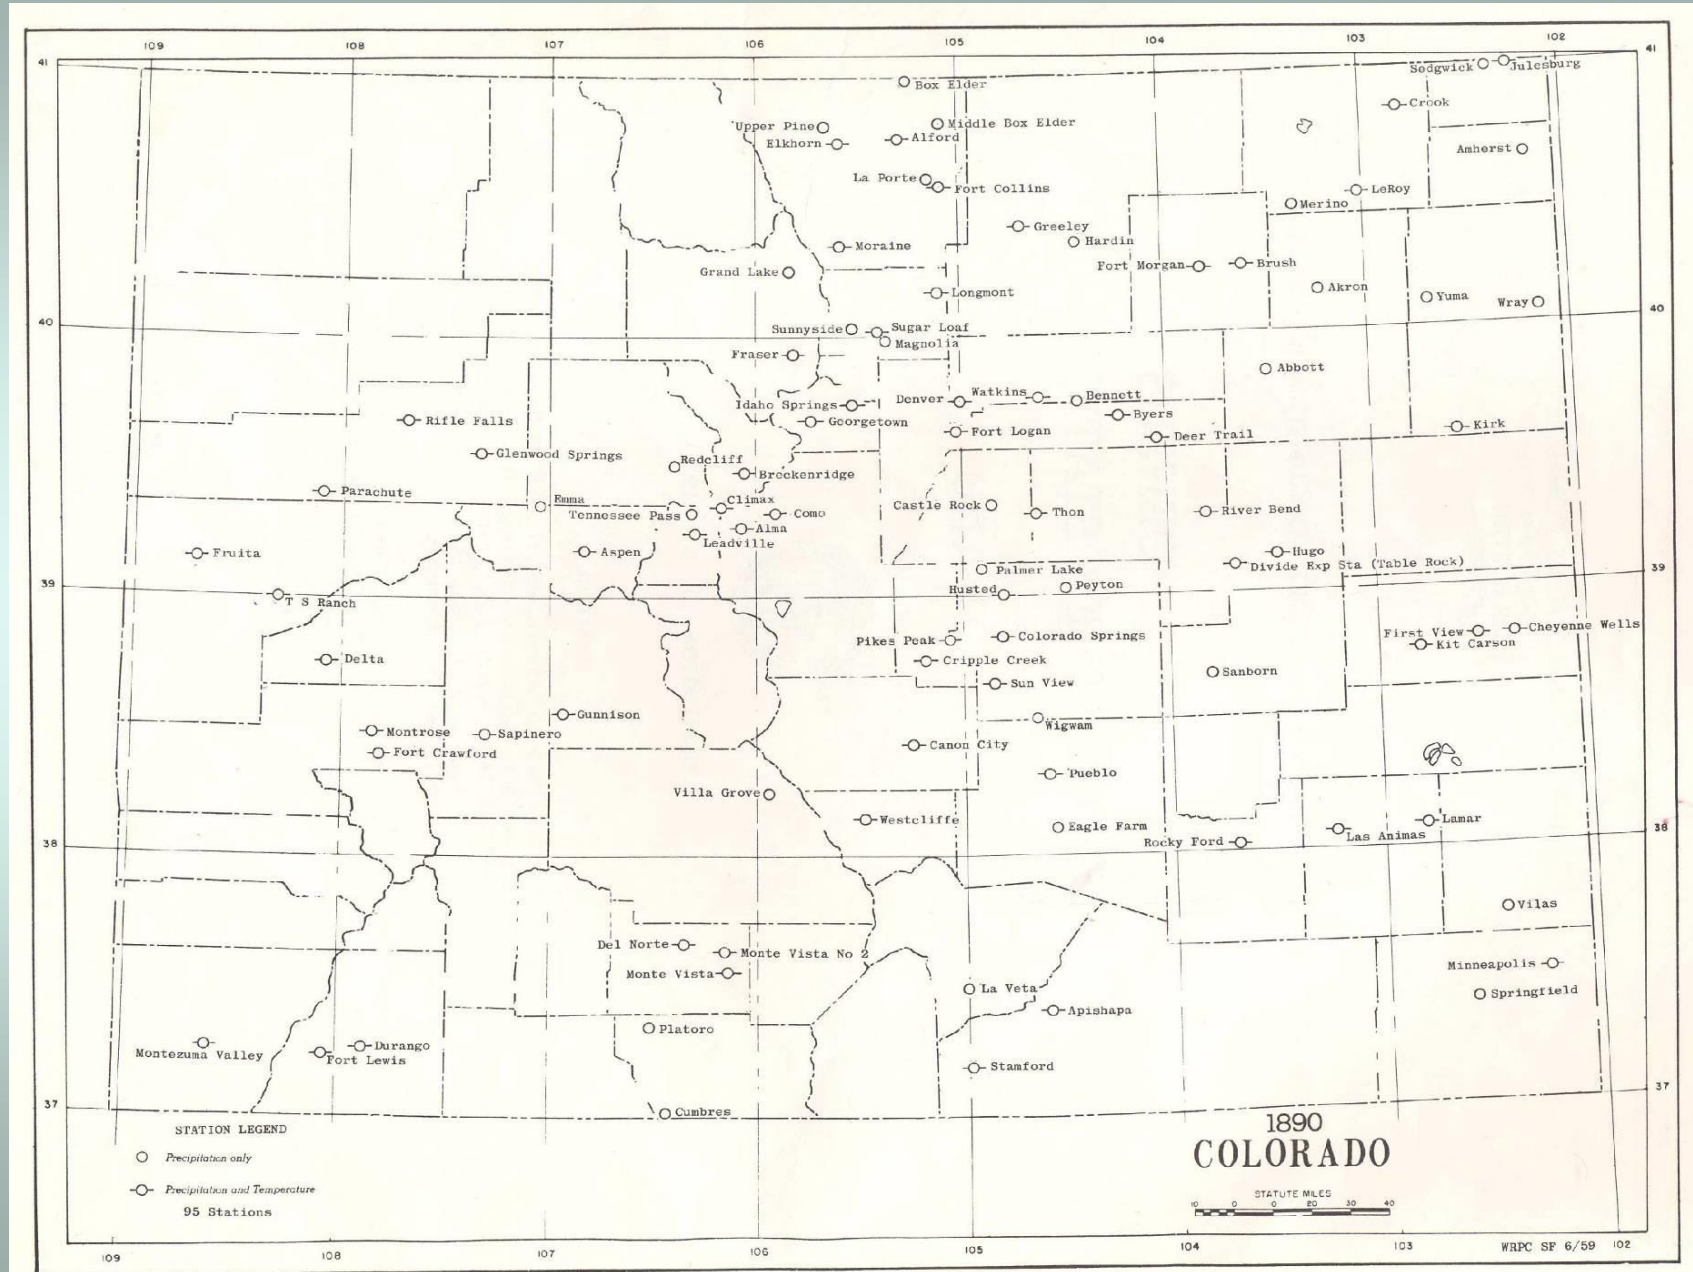

Today's Roadmap

- **Some history: what have we learned about Colorado's climate in the last 150 years?**
- **What's going on with Climate Change? How does it impact us here?**
- **How can you help?**

Our Mission

- The Colorado Climate Center at CSU, in partnership with the state and federal Agricultural Experiment Stations provides climate expertise to the residents of the state through its threefold program of:
 - 1) ***Climate Monitoring*** (data acquisition, analysis, and archiving)
 - 2) ***Climate Research***
 - 3) ***Climate Services***.(providing data, analysis, climate expertise, education and outreach)

Weather Data in W. Colorado go back 130 years

Snow surveys began in the 1930s to help predict seasonal streamflow

Places warm enough to grow are too dry, and
places wet enough to grow are too cold...
Thank goodness for rivers!

What makes Colorado Climate so different from place to place?

1. Altitude
2. Windward vs Leeward side of mountain
3. Latitude

...and in that order. The difference in average temperature between Las Animas and Pike's Peak is roughly the same as between Florida and Iceland!

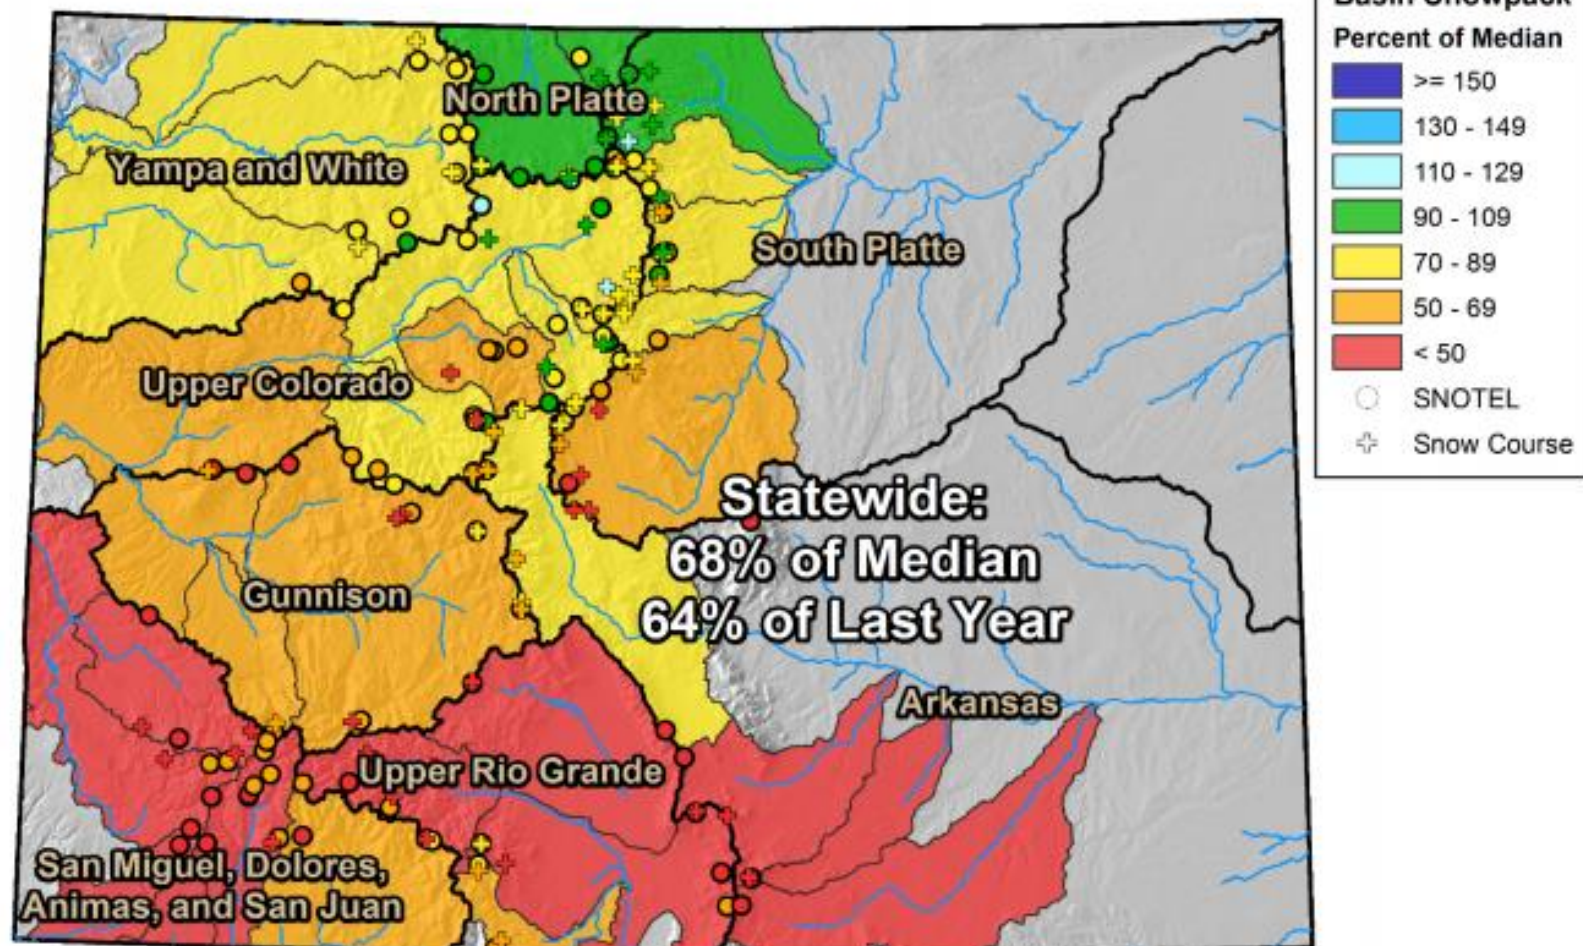

Colorado, Climate Division 2, Precipitation, October-September

This year to year variability keeps life interesting, and sometimes challenging

GFS Modeled Water Vapor Transport

Colorado, Climate Division 2, Average Temperature, October-September

Temperatures vary naturally from year-to-year too, but they are getting consistently warmer

This warming pattern is not unique to Colorado

Atmospheric CO₂ at Mauna Loa Observatory

What underlies these long-term temperature changes? A Changing Greenhouse Effect

- Earth's equilibrium temperature is 57 F. Without GHGs it would be 0 F.
- Our best piece of evidence for the greenhouse effect: we survive at night

Why is this such a hard problem?

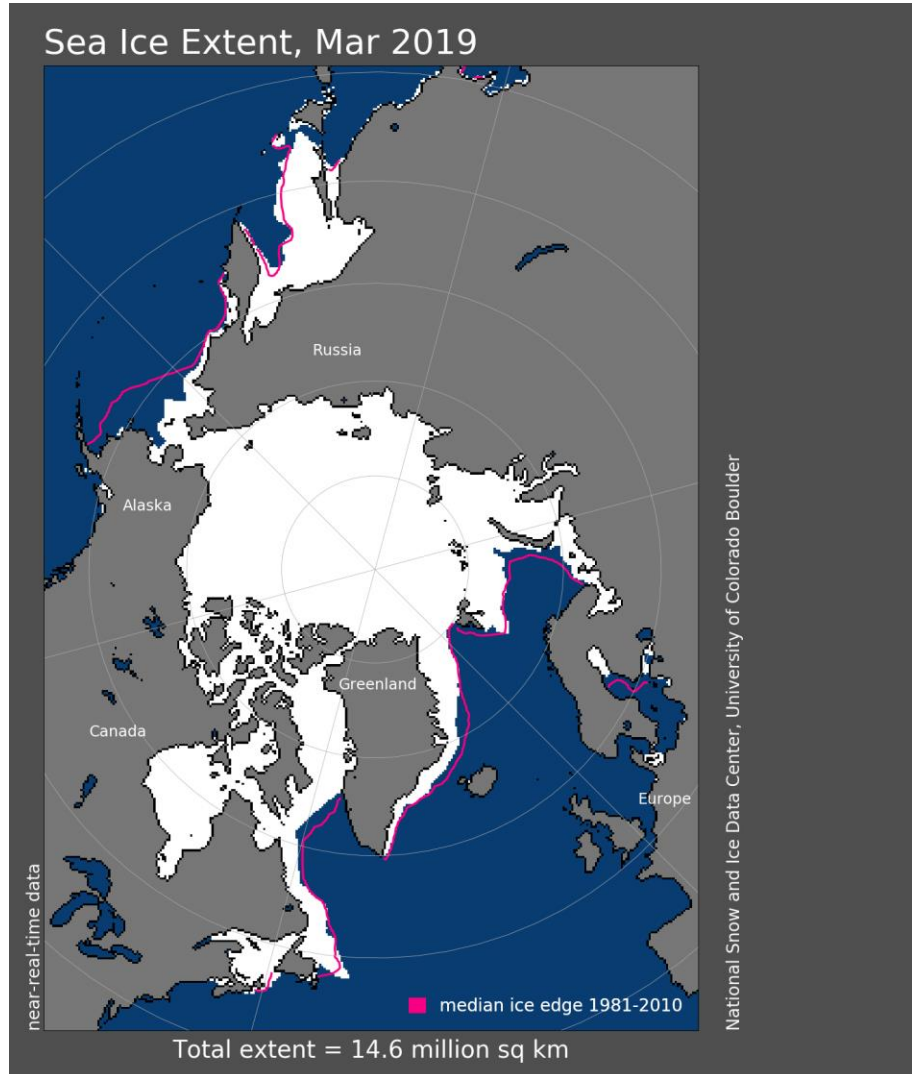

The main answer: climate feedbacks

Our earth system may respond in a number of ways to an induced change. Cloud coverage, and cloud types can change with temperature, ice extent changes, biomass changes, and the concentration of other greenhouse gasses changes

Some of these changes add to the initial warming push, others might mitigate it, but ultimately, what wins?

Positive feedback: + CO₂ -> + temperature -> - ice cover -> - surface reflection -> + temperature

Negative feedback: + CO₂ -> + temperature -> + precipitation -> + vegetation -> - CO₂ -> - temperature

Rising temperatures, rising risks

Key to impacts and risks

Warming has not been good for our snowpack

There's still loads of variability from one year to the next!

Our Big Concern Locally and Regionally: Water

- The supply and demand balance for water is shifting in the Colorado River Basin with more people moving into the region every year.
- Hotter than historic conditions are contributing to reductions in streamflow in the Colorado River Basin (Udall and Overpeck 2014)

Blue Mesa Reservoir Level 2019-03-08
52 Percent of 1981-2017 Average

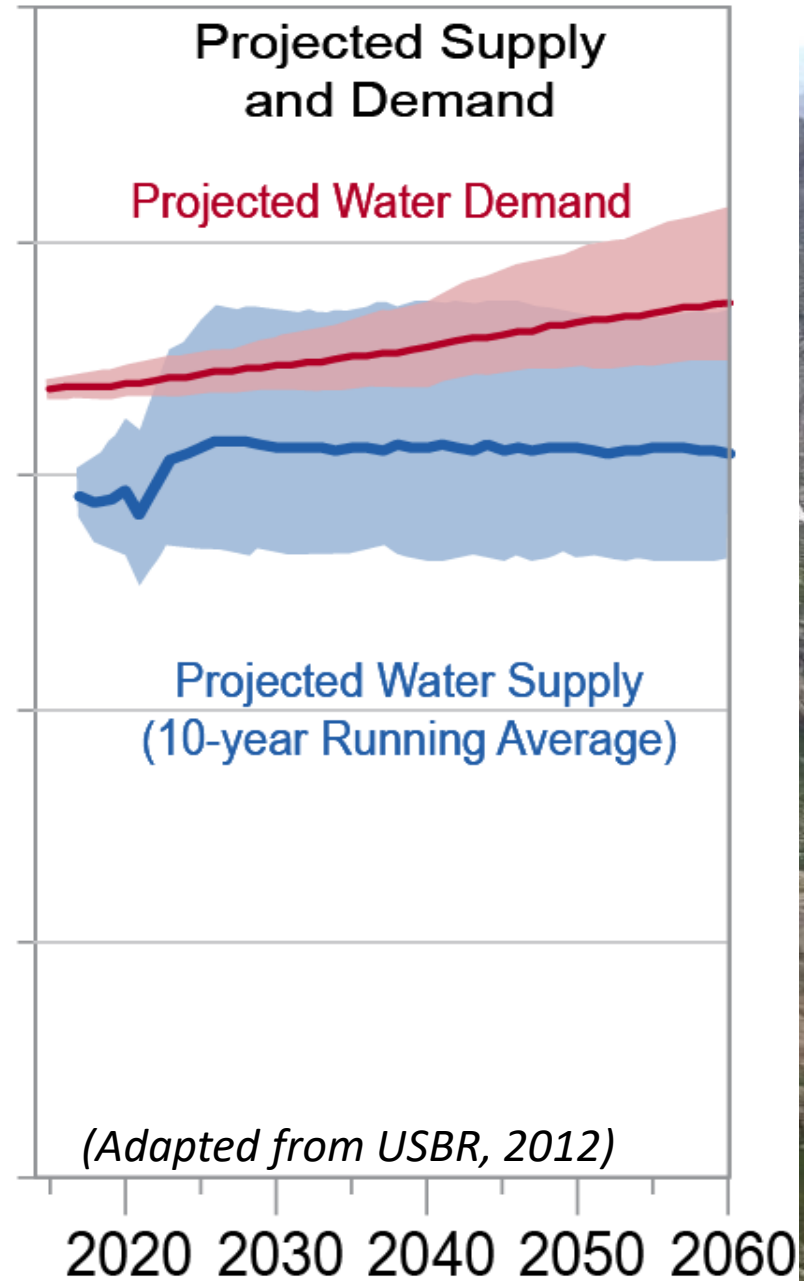

Hot, dry conditions severely damage our water supplies

(Adapted from USBR, 2012)

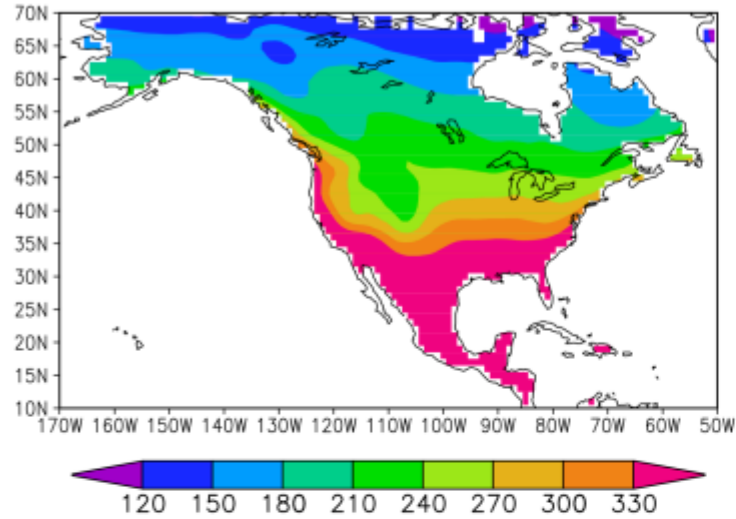

Colorado, Climate Division 2, Precipitation, October-September

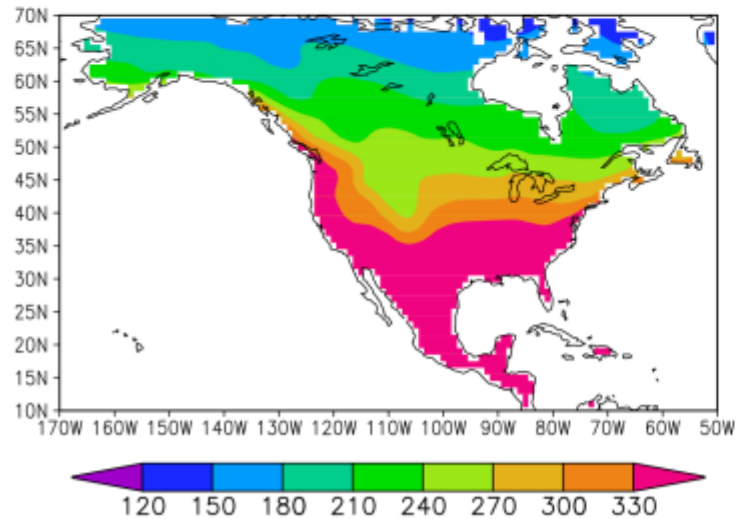

Is the climate naturally variable too? Yes! Even in a warmer climate, there will be big differences from one year to the next just like today

And the growing season is lengthening. That's good when we have the water to sustain it.

MME Mean Growing Season Length (1971–2000)

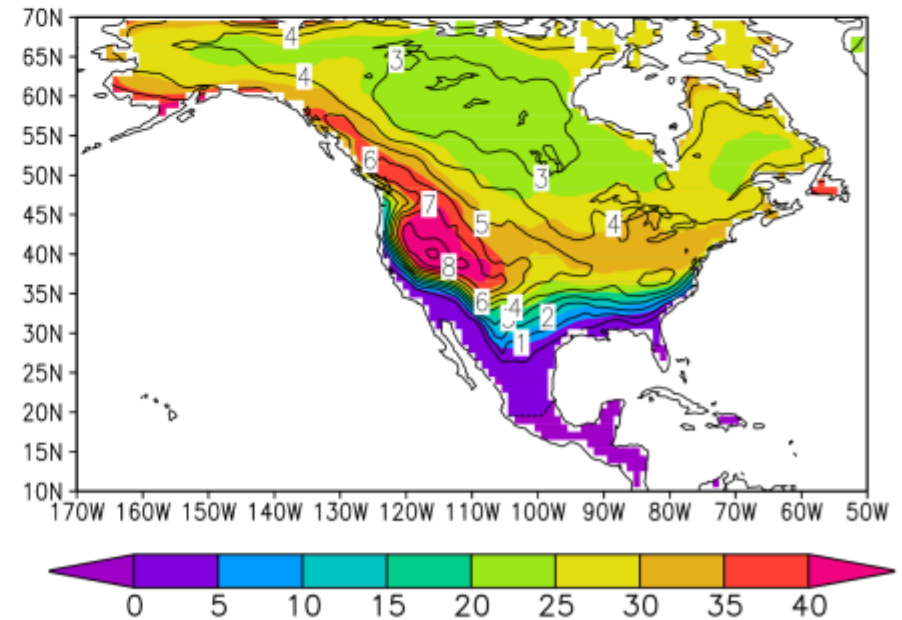

MME Mean Growing Season Length (2071–2100)

Change in Growing Season Length

Conclusions

- Colorado is a beautiful and diverse landscape where the climate varies dramatically over short distances based on topography
- In over 100 years of measuring weather conditions, we see that wild swings in weather are part of what makes Colorado special. The sun will continue to shine, and every year will be unique based on what the winds blow in
- The climate is warming, largely because we are changing the chemistry of the atmosphere. This will have profound impacts on our state and our planet. How much things change is uncertain, but it's largely up to us
- Producing more of our energy from sustainable resources can help us preserve this beautiful land for generations to come

Thanks, and let's keep in touch!
